

CubeSat KitTM Pluggable Processor Module (PPM) A2 Hardware Revision: B

PPM with TI's MSP430F1611 for CubeSat Kit Motherboard

Applications

- CubeSat nanosatellite control, C&DH, TT&C
- General-purpose low-power computing for CubeSat Kit architecture
- Remote sensing for harsh environments

Features

- For CubeSat Kit Motherboard (MB)
- TI's MSP430F1611 16-bit microcontroller (MCU)
- 50KB program memory, 10KB on-chip SRAM
- Integrated peripherals:
 - 2 SCIs (UART0/SPI0/I2C & UART1/SPI1)
 - 8-channel 12-bit ADC
 - 2-channel 12-bit DAC
 - 16-bit Timer A3
 - 16-bit Timer B7
 - 3-channel DMA
 - On-chip comparator
 - SVS, BOR, WDT, JTAG, etc.
- 7.3728MHz & 32.768kHz clock crystals
- PCA9515A I2C isolator
- Ultra-low power operation
- Independent latchup (device overcurrent)
 protection
- Independent external reset supervisor (POR/BOR)
- Small-size PPM footprint
- 4-layer gold-plated blue-soldermask PCB
- Compatible with Pumpkin's Salvo[™] RTOS and HCC-Embedded's EFFS-THIN SD Card file FAT file system for ease of programming

ORDERING INFORMATION

Pumpkin P/N 710-00486

CubeSat Kit PPM A2 Rev. A

CHANGELOG

Rev.	Date	Author	Comments
A	20090728	AEK	Initial revision.
В	20090808	AEK	Added photo.
С	20100113	AEK	Revised I _{SLEEP} based on lot testing of PCA9515A.

OPERATIONAL DESCRIPTION

PPM A2 enables CubeSat Kit customers to utilize TI's ultralow-power MSP430 processor on a CubeSat Kit Motherboard (MB). PPM A2 uses the 64-pin MSP430F1611IPM, with a wide selection of on-chip peripherals. Additionally, a PCA9515A I2C isolator is present to facilitate I2C interfacing.

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Units
Operating temperature	T _A	-40 to +85	°C
Voltage on +5v_USB bus			
Voltage on +5v_svs bus		-0.3 to +6.0	V
Voltage on -FAULT_OC open-collector output			
Voltage on vcc bus		-0.3 to +3.6	V
Voltage on vcc_sp bus		-0.3 10 +3.0	v
Voltage on any MSP430 I/O pin		-0.3 to 3.6	V
Diode current at any MSP430 pin		-2 to +2	mA
DC current through any pin of PPM connector H1	I _{PIN_MAX}	1.2	Α
MSP430 operating frequency	$f_{OP MAX}$	7.4	MHz

Refer to the MSP430x161x family datasheet for additional absolute maximum ratings associated with processor **U1**, especially per-pin current limits.

PHYSICAL CHARACTERISTICS

Parameter	Conditions / Notes	Symbol	Min	Тур	Max	Units
Mass				11		g
Height of components above PCB					2	mm
Height of components below PCB ¹					4	mm
PCB width				54.6		mm
PCB length	Small-size PPM			53.4		mm
PCB thickness				1.6		mm

SIMPLIFIED MECHANICAL LAYOUT ²

PPM A2 is implemented on a small-size PPM PCB, as shown below.

¹ Not including connector H1.

² Dimensions in inches.

ELECTRICAL CHARACTERISTICS

(T = 25°C, +5V bus = +5V unless otherwise noted)

Parameter	Conditions / Notes	Symbol	Min	Тур	Max	Units
Reset voltage	+5v_svs reduced until MCU resets	V _{RESET_MAX}			3.1	V
Operating Voltage		V _{cc}		3.3		V
SD Card Voltage		V _{CC_SD}		3.3		V
	LPM0, MCLK = DCO	I _{OP}		3		mA
Operating current	LMP4, all control outputs inactive, I2C isolator 0 5 fitted	I _{SLEEP}	400		1000	μA
Low-frequency clock frequency	LFXTAL	$f_{\sf CLK_LF}$	32	.768 ± 0.0	01	kHz
DCO clock frequency	DCOCLK	f_{CLK} dco	680	760	840	kHz
High-frequency clock frequency	HFXTAL	f _{clk_hf}	7.3	728 ± 0.0	005	MHz
Overcurrent trip point for vcc	Set by R3	I _{TRIP_VCC}		220		mA
Time to switch between +5v_svs and +5v_usb power sources	Automatic				1	μs

For more information on TI's MSP430 ultralow-power microcontrollers, refer to the TI datasheets.

BLOCK DIAGRAM

PPM A2 provides regulated and current-limited +3.3V power, an external POR/BOR reset supervisor, a JTAG interface for programming and debugging, two clock sources, an external I2C isolator, connections to all 48 I/O pins of the PPM connector, shared MB control and radio handshaking signals, and a single-point analog/digital ground. All of the 64-pin MSP430's pin are used, some for multiple purposes.

PPM PIN DESCRIPTIONS

The PPM connector **H1** connects the PPM to resources residing on the MB and to resources accessible via the CubeSat Kit Bus connector.³

Those signals that are connected directly to the PPM connector and to the CubeSat Kit Bus connectors are tagged under the CSKB label below.⁴ Signals marked with an '*' are associated with dedicated peripherals on the MB. Some may also be used with off-board peripherals through the proper use of MB peripheral enables and MB power control.

The *potential* for a pin's function is described by the I/O field. The *recommended usage* (as a digital or analog input or output, or as a power pin) is listed in the Description field. I/O pins can generally be configured as general-purpose I/O if the recommended usage is not desired.

Inputs are signals *from* the MB *to* the PPM's processor **U1** or other circuitry. *Outputs* are signals *from* the PPM's processor **U1** or other circuitry *to* the MB.

³ Not included. MBs are purchased separately from PPMs.

⁴ The CubeSat Kit's system peripherals are numbered from 0 onwards (e.g., U0, SPI0, etc.), and this nomenclature is used when referring to a PPM or CSK bus signal. The MSP430's peripheral nomenclature begins with 0 (e.g., UART0, SPI0, etc.), and is used when referring to peripherals, signals and registers internal to the MSP430.

PPM PIN DESCRIPTIONS – I/O

IO.37	H1.21	I/O	•	General-purpose I/O. To/from P1.5 (U1.17).
IO.38	H1.19	I/O	•	General-purpose I/O. To/from P1.6 (U1.18).
10.39	H1.17	I/O	•	-OE_USB/-INT. MB control/status signal. To/from P1.7 (U1.19). Part of the MB's USB and RTC interfaces. P1.7 is normally configured as a digital output. See -OE_USB and -INT signal descriptions, below.
10.40	H1.15	I/O	•	AN.0/HS0. Analog input or MB handshake signal. To/from P6.0 (U1.59). Part of the MB's MHX interface. P6.0 is normally configured as a digital input. See HS0 signal description, below. Can also be used as a general-purpose I/O or an analog input.
10.41	H1.13	I/O	•	AN.1/HS1. Analog input or MB handshake signal. To/from P6.1 (U1.60). Part of the MB's MHX interface. P6.1 is normally configured as a digital input. See HS1 signal description, below. Can also be used as a general-purpose I/O or an analog input.
10.42	H1.11	I/O	•	AN.2/HS2. Analog input or MB handshake signal. To/from P6.2 (U1.61). Part of the MB's MHX interface. P6.2 is normally configured as a digital input. See HS2 signal description, below. Can also be used as a general-purpose I/O or an analog input.
10.43	H1.9	I/O	•	AN.3 /HS3. Analog input or MB handshake signal. To/from P6.3 (U1.2). Part of the MB's MHX interface. P6.3 is normally configured as a digital output. See HS3 signal description, below. Can also be used as a general-purpose I/O or an analog input.
10.44	H1.7	I/O	•	AN.4 / HS4 . Analog input or MB handshake signal. To/from P6.4 (U1.3). Part of the MB's MHX interface. P6.4 is normally configured as a digital output. See HS4 signal description, below. Can also be used as a general-purpose I/O or an analog input.
10.45	H1.5	I/O	•	AN.5/HS5. Analog input or MB handshake signal. To/from P6.5 (U1.4). Part of the MB's MHX interface. P6.5 is normally configured as a digital output. See HS5 signal description, below. Can also be used as a general-purpose I/O or analog input.
10.46	H1.3	I/O	•	AN.6 /-OE_MHX. Analog input or MB control signal. To/from P6.6 (U1.5). Part of the MB's MHX interface. P6.6 is normally configured as a digital output. See -OE_MHX signal description, below. Can also be used as general-purpose I/O or an analog output.
10.47	H1.1	I/O	•	AN.7 . Analog input. To/from P6.7 (U1.6). Can also be used as a general-purpose I/O or an analog output.

PPM PIN DESCRIPTIONS – Power

Name	Pin	I/O	CSKB	Description
+5V_USB	H1.49 H1.50	-	•	+5V USB power. From USB host. Powers PPM.
+5V_SYS	H1.51 H1.52	-	•	+5V system power. From EPS or external +5V connector. Powers PPM.
VCC_SD	H1.53 H1.54	-		+3.3V SD Card power. From PPM's vcc.
vcc	H1.55 H1.56	-		+3.3V PPM power, MB power and I/O level. From PPM LDO U4 using +5v_sys and/or +5v_USB.
DGND	H1.57 H1.58	-	•	Digital ground.
AGND	H1.59 H1.60	-	•	Analog ground.
VBATT	H1.61 H1.62	_	•	Not connected.
VBACKUP	H1.63 H1.64	-	•	Not connected.

PPM PIN DESCRIPTIONS – Analog References

Name	Pin	I/O	CSKB	Description
VREF0	H1.66	-	•	Positive analog voltage reference. To/from VREF+ (U1.7).
VREF1	H1.68	-	•	Positive analog voltage reference. To/from VEREF + (U1.10).
VREF2	H1.70	-	•	Negative analog voltage reference. To/from VREF- (U1.11).

PPM PIN DESCRIPTIONS – Reserved

Name	Pin	I/O	CSKB	Description
RSVD0	H1.72	-	•	Not connected. Reserved for future use.
RSVA1	H1.74	-	•	Not connected. Reserved for future use.
RSVD2	H1.76	-	•	Not connected. Reserved for future use.

PPM PIN DESCRIPTIONS – MB-Specific

Name	Pin	I/O	CSKB	Description
CB4	H1.78			Not connected.
USBDP	111.70	I		Not connected.
CB2				Not connected.
USBDM	H1.80	I		Not connected.
-ON_SD	H1.82	0		Control signal for SD Card power. From P4.5 (U1.41). Active LOW, pulled high on the MB. When active, enables VCC_CARD on the MB, thereby powering SC Card socket and SD Card level translators / isolators. Normally configured as a digital output.
-ON_MHX	H1.84	0		Control signal for MHX socket power. From P4.6 (U1.42). Active LOW, pulled high on the MB. When active, enables PWR_MHX on the MB, thereby powering MHX socket and MHX level translators / isolators. <i>Normally configured as a</i> <i>digital output.</i>
-OE_MHX	H1.86	0		Control signal for MHX interface. From P6.6 (U1.5). Active LOW, pulled high on the MB. When active, enables signals to pass through MHX level translators / isolators. <i>Normally configured as a digital output.</i>
-OE_USB	H1.88	0		Control signal for USB interface. From P1.7 (U1.19). Active LOW, pulled high on the MB. When active, enables signals to pass through USB level translators / isolators. <i>Normally configured as a digital output.</i>

-INT		I	Output from RTC's -IRQ open-collector output. To P1.7 (U1.19). When properly configured, can be used to interrupt processor U1 via MB RTC. <i>Normally configured as a digital</i> <i>input.</i>	
HS0	H1.90	I	Handshake signalRTS (USB) or -CTS (MHX). To P6.0 (U1.59). Normally configured as a digital input. Requires that R10 be fitted on the MB.	
HS1	H1.92	I	Handshake signalDTR (USB) or -DSR (MHX). To P6.1 (U1.60). Normally configured as a digital input. Requires that R11 be fitted on the MB.	
HS2	H1.94	I	Handshake signalPWE (USB) or -DCD (MHX). To P6.2 (U1.61). Normally configured as a digital input. Requires the R12 be fitted on the MB.	
HS3	H1.96	0	Handshake signalCTS (USB) or -RTS (MHX). From P6.3 (U1.2). Normally configured as a digital output. Requires that R75 be fitted on the MB.	
HS4	H1.98	0	Handshake signalRI (USB) or -DTR (MHX). From P6.4 (U1.3). Normally configured as a digital output. Requires that R76 be fitted on the MB.	
HS5	H1.100	0	Handshake (reset) signalRST (USB) or -RST (MHX). From P6.5 (U1.4). Normally configured as a digital output. Requires that R77 be fitted on the MB.	

PPM PIN DESCRIPTIONS – Control & Status

Name	Pin	I/O	CSKB	Description	
-FAULT_OC	H1.65	0		Open-collector output from PPM's latchup prevention overcurrent switch. Active LOW. Wire-ORed to -FAULT_OC on the MB.	
SENSE	H1.67	-	 Can be used to measure PPM's current consumption. The current used by the PPM from a single source is (source – sense) / 75mΩ. Depends on PPM implementation. 		
-RESET	H1.69	Ι	Reset signal to PPM's reset supervisor. Active LOW.		
OFF_VCC	H1.71	Ι	Control signal to PPM's power circuit(s). Active HIGH.		

PPM PIN DESCRIPTIONS – I2C Bus

Name	Pin	I/O	CSKB	Description	
				I2C data. To/from P3.1/SDA (U1.29) through I2C isolator U5	
SDA SYS	H1.73	I/O	•	when ON_I2C is active. Part of the I2C interface. SDA is	
DDR_DID	111.75			normally configured as an I2C data input/output as part of	
				USART0:I2C when the I2C peripheral is active.	
				I2C clock. From P3.3/SCL (U1.31) through I2C isolator U5	
SCL SYS	H1.75	0	•	when on_12C is active. Part of the I2C interface. SCL is	
DCH_212				normally configured as an I2C clock output as part of	
				USART0:I2C when the I2C peripheral is active.	

PPM PIN DESCRIPTIONS – User-defined

Name	Pin	I/O	CSKB	Description	
USER0	H1.77	I/O	•	Not connected.	
USER1	H1.79	I/O	•	Not connected.	
USER2	H1.81	I/O	Not connected.		
USER3	H1.83	I/O	Not connected.		
USER4	H1.85	I/O	Not connected.		
USER5	H1.87	I/O	•	Not connected.	
USER6	H1.89	I/O	•	Not connected.	
USER7	H1.91	I/O	•	Not connected.	

CubeSat Kit PPM A2 Rev. A

USER8	H1.93	I/O	•	Not connected.
USER9	H1.95	I/O	•	Not connected.
USER10	H1.97	I/O	•	Not connected.
USER11	H1.99	I/O	•	Not connected.

SHARED I/O PINS

All of **U1**'s I/O pins are connected directly to the CubeSat Kit Bus. Due to the relatively low pincount of the MSP430F1611 used on PPM A2, some of the general-purpose I/O pins are also connected to other signals on PPM connector **H1**. Generally speaking, these shared I/O pins are dedicated to ancillary functions and should not be used by modules on the CubeSat Kit Bus. Provisions are in place to "free" some of these shared I/O pins from their ancillary functions, as outlined below.

Pin	Signal	Standalone Function	Ancillary Function	Notes
P1.7	-OE_USB/-INT	-OE_USB, -INT	I/O	Always connected to USB interface. Pulled up via $100k\Omega$ to vcc on the MB. Can be isolated from RTC by removal of R73 on the MB. Can be used as simple I/O if VCC_IO is not present on the MB ⁵ and RTC on the MB is configured to ignore -OE_USB/-INT.
P4.5	-ON_SD	-ON_SD	none	Always connected to SD Card interface. Pulled up via 100kΩ to vcc on the MB. Arbitration with u1 can permit other devices to control the MB's SD Card interface.
P4.6	-ON_MHX	-ON_MHX	I/O	Always connected to MHX power switching. Pulled up via 100kΩ to vcc on the MB. Arbitration with u1 can permit other devices to power an MHX transceiver on the MB. Can be used as I/O if no source of power is available on the MB to power MHX socket.
P6.0	HS0	нзо	I/O, analog input	When R10 on the MB is fitted, to be used as a handshake line to USB or MHX. When R10 on the MB is <i>not</i> fitted, to be used as analog input or digital I/O.
P6.1	HS1	HS1	I/O, analog input	When R11 on the MB is fitted, to be used as a handshake line to USB or MHX. When R11 on the MB is <i>not</i> fitted, to be used as analog input or digital I/O.
P6.2	HS2	HS2	I/O, analog input	When R12 on the MB is fitted, to be used as a handshake line to USB or MHX. When R12 on the MB is <i>not</i> fitted, to be used as analog input or digital I/O.
P6.3	HS3	н53	I/O, analog input	When R75 on the MB is fitted, to be used as a handshake line to USB or MHX. When R75 on the MB is <i>not</i> fitted, to be used as analog input or digital I/O.
P6.4	HS4	HS4	I/O, analog input	When R76 on the MB is fitted, to be used as a handshake line to USB or MHX. When R76 on the MB is <i>not</i> fitted, to be used as analog input or digital I/O.
P6.5	HS5	HS5	I/O, analog input	When R77 on the MB is fitted, to be used as a handshake line to USB or MHX. When R77 on the MB is <i>not</i> fitted, to be used as analog input or digital I/O.

⁵ I.e., if USB is not connected.

P6.6	-OE_MHX	-OE_MHX	I/O	Always connected to MHX interface. Pulled up via 100kΩ to vcc on the MB. Can be used as an analog input, analog output or simple I/O when DPWR_MHX on the MB is off.
------	---------	---------	-----	---

For example, if $-ON_MHX$ is kept inactive, DPWR_MHX on the MB is off. Therefore MB MHX isolators U2 and U3 are left in a high-impedance state, and P6.[7..0] can all be used as analog inputs, getting their signals from the CubeSat Kit Bus via I0.[47..40].⁶ This is true regardless of the state of the resistors R10-R12 and R75-R77 on the MB. For further information, consult the PPM A2 and MB schematics.

I2C ISOLATOR

On PPM A2, **U5** is an I2C bus isolator implemented via a PCA9515A. The purpose of **U5** is to ensure that the I2C peripherals attached to the I2C bus via **SCL_SYS** and **SDA_SYS** do not see spurious clock and/or data signals when SPI activity is present on SPI0, which might cause problems with the I2C bus. I2C signals to/from **U1** can only reach the I2C bus when **ON_I2C** is active. Therefore, when **ON_I2C** is inactive, **U1** can perform SPI activity on SPI0 (e.g., read from and write to the SD Card on the MB) without fear of I2C bus problems.

υ5 has a quiescent current consumption I_{SLEEP} of around 500μA, regardless of the state of on_ice. This sets the floor for I_{SLEEP} . Users not requiring I2C connectivity, or wishing to implement an I2C isolator elsewhere in the system, can remove **υ5**, thereby reducing I_{SLEEP} to under 40μA.⁷

CONNECTORS

ltem	Description	Source	Part Number	Application
1	100-pin,	Samtec	LSS-150-01-L-DV	PPM connector (standard, +3mm)
	hermaphroditic			ζ, , , , , , , , , , , , , , , , , , ,

This connector information is provided for reference only.

PROGRAMMING & DEBUGGING

PPM A2 provides one interface for programming and debugging – the popular and low-cost Flash Emulation Tool (FET) interface, a type of JTAG interface. It is implemented via Flexible Printed Circuit (FPC) connector on the PPM.

8-pin FPC connector **J1** is for the FET. Via Pumpkin's JFPC-MSP430 adapter, customers can connect either a traditional TI USB or parallel FET, or an aftermarket FET, all with 14-pin 2x7 0.100" pitch dual-inline headers. The JFPC-MSP430 connects to PPM A2 via an 8-conductor FPC cable.

NOTES

PPM A2 (MSP430F1611) is built on the same Pumpkin PCB (705-00378) as PPM A1 (MSP430F1612) and PPM A3 (MSP430F2618), with minor differences in the components placed at assembly time.

⁶ Even if an analog signal drives P6.6 (-OE_MHX) below the input threshold of U1 or U2, the isolators remain in their high-impedance state because DPWR_MHX (enabled via -ON_MHX) is off.

 $^{^{7}}$ I_{SLEEP} of 40µA is representative of the quiescent current of the previous-generation FM430 flight module, of which the MB + PPM A2 combination is a superset.
