

# CubeSat Kit™ Motherboard Module (MBM) 2

Hardware Revision: C

# Motherboard for BeagleBone Black (BBB)

### Applications

- CubeSat nanosatellites
- SUPERNOVA<sup>™</sup> nanosatellites

### Features

- For use with 104-pin CubeSat Kit™ Bus
- Hosts BeagleBone Black (BBB) as a single 0.600" tall CSK-compatible module
- Multiple +5V power sources supported, auto-selected
- BBB Ethernet, USB host & USB device ports fully supported
- BBB 4.5x UART, 1x I2C & 6x GPIO mapped to CSK Bus Connector
- Power-on fully protected I/O
- On-board reset circuitry, drives BBB's sys\_RESETn and GPIO buffers
- On-board SD Card interface (SPI mode)
- On-board Real-Time Clock (RTC) with battery backup
- On-board -RESET & OFF\_VCC-driven WDT interface
- Independent latchup (device overcurrent) protection on critical subsystems
- PC/104-size footprint
- Stackable 104-pin CubeSat Kit Bus connectors includes processor's complete I/O space, user-assignable signals and more
- Wiring-free module interconnect scheme
- 4-layer gold-plated blue-soldermask PCB with ground plane for enhanced signal integrity

### **ORDERING INFORMATION**

В	20151016	AEK	Added block diagram, list of supported BBBs, clarifying remarks.

# **OPERATIONAL DESCRIPTION**

The Motherboard Module 2 is a CubeSat Kit (CSK)-compatible host for the COTS BeagleBone Black (BBB) Rev C and compatible variants thereof. When installed onto an MBM 2, the BBB interfaces to the CSK electrical bus via standardized signals. Additional features like a Real-Time Clock (RTC) with battery backup and a full-size SD Card operating in SPI mode are also provided.

Four and a half UARTs (two with -CTS/-RTS flow control), one SPI, one I2C, five general-purpose outputs and one general-purpose input are mapped between the BBB and the CSK bus connector.

BBB Signal	Description	CSK Signal			
UART1_RXD	BBB UART 1 receive				
UART1_TXD	BBB UART 1 transmit	The "second" CSK UART (Ux1), with flow control. Historically, this serial			
UART1_RTSn	BBB UART 1 flow control	channel has been used to communicate with a radio / modem.			
UART1_CTSn	BBB UART 1 flow control				
UART2_RXD	BBB UART 2 receive	The "third" CSK UART (Ux2), without flow control. Historically, this serial channel has been used to communicate with a GPS receiver and/or other			
UART2_TXD	BBB UART 2 transmit	serial devices.			
UART3_TXD	BBB UART 3 transmit	The "fifth" CSK UART (Ux4), transmit only.			
UART4_RXD	BBB UART 4 receive	The "fourth" CSK UART (Ux3), without flow control. Historically, this serial			
UART4_TXD	BBB UART 4 transmit	channel has been used to communicate with a GPS receiver and/or other serial devices.			
UART5_RXD	BBB UART 5 receive				
UART5_TXD	BBB UART 5 transmit	The "first" CSK UART (Ux0), with flow control. Historically, this serial channel			
UART5_RTSn	BBB UART 5 flow control	has been used to communicate with an ADACS.			
UART5_CTSn	BBB UART 5 flow control				
SPI1_SCLK					
SPI1_DO	BBB SPI 1 interface	The "first" CSK SPI (SPI0). Historically, this interface has been used to			
SPI1_DI	DDD SI'I I Internace	communicate with an SD card hosting a FAT filesystem.			
SPI1_CS0					
GPI02_22					
GPIO2_23	BBB general-purpose output	General-purpose output			
GPI02_24		Scheral-purpose Sulput			
GPI02_25					
GPIO2_1	BBB general-purpose input	General-purpose input			
I2C1_SDA	BBB I2C data	The "first" I2C. Historically, this interface has been used to communicate with			
I2C1_SCL	BBB I2C clock	various subsystems.			

#### Table 1: MBM 2 BBB-to-CSK bus connector digital signal mappings

Additionally, seven dedicated analog inputs are mapped from the CSK bus connector to the BBB's analog inputs.

Power-on and reset behavior of the combined MBM 2 + BBB is carefully controlled to ensure proper operation and protection of BBB I/O when interfacing to other modules through the CSK bus connector. This is accomplished via high-speed, zero-power level-shifter / isolators between the BB and the CSK bus connector. The isolators are disabled while the BBB is in reset, and are enabled once the BBB comes out of reset and is ready to handle signals at its I/O pins. This protection prevents non-phased power sequencing within the CSK architecture from damaging the BBB's I/O.<sup>1</sup>

An external watchdog timer (WDT) interface is provided.

BBB features that remain untouched and that can be used independently of the CSK bus connector include:

- Ethernet (via 100BaseT / RJ45)
- USB host (via USB type A)
- USB device (via USB micro-B)
- HDMI (via micro-HDMI)
- SD card (via micro-SD socket)
- COM0 (via 1x6 SIP header)
- External +5Vdc power (via 2.1/5.5mm barrel jack)

<sup>&</sup>lt;sup>1</sup> The I/O protection afforded by the MBM 2's I/O isolators applies only to digital I/O. The BBB's analog inputs are connected directly to the BBB's analog input pins. Users should control analog inputs to the BBB via the -BUFF\_EN output signal.

The BBB operates from system +5Vdc power (+5v\_svs). BBB I/O (and therefore its I/O signals on the BBB bus connector) operates at +3.3V logic levels.

Note that unlike other Pumpkin Pluggable Processor Modules (PPMs) with general-purpose I/O mapped to the CSK bus connector, the MBM 2 provides unidirectional signals (and power-on sequencing and protection) between the BBB and the CSK bus connector, on a per-GPIO-pin basis. Also, note that not all of the BBB's **P8** and **P9** pins are mapped to the CSK bus connector. Future revisions of the MBM 2 may map additional BBB pins to the CSK bus connector, and/or may allow for bidirectional digital I/O signals.

# ABSOLUTE MAXIMUM RATINGS

# Compatibility

MBM 2 has been tested with and is intended for use with the following instances of the open-source BeagleBone Black design: $^{5}$ 

Manufacturer	Product Name / ID	Supported?	Notes
CircuitCo, LLC	BeagleBone Black	yes	Rev C. Digi-Key® P/N BB-BBLK-000-REVC-ND <sup>6</sup>
Element 14	BeagleBone Black	no	

#### Power

The MBM 2 draws its power from the CSK's +5v\_sys and/or +5v\_USB, and uses the resultant +5Vdc power to generate a local 3.3V (vCC) as well as to power the BBB at +5Vdc. +5Vdc power drawn from +5v\_sys is current-limited and will automatically trip and reset if the setpoint is exceeded. vCC is used to drive peripherals on the MBM 2 (e.g., RTC and SD Card) and to establish the I/O voltage level for the BBB.

+5Vdc power can also be applied (at any time) via the BBB's barrel jack connector P1 and/or its mini-USB device connector.<sup>7</sup> The various power possibilities are shown below. The BBB is on whenever a +5V power source (internal or external) is connected to the MBM 2 + BBB.

Bus power	USB Host	External +5V power	+5V_SYS	+5V_USB	BBB
enabled	connected	input at P1	power	power	status
			off	off	off
٠			on	off	on
		•	off	off	on
•		•	on	off	on
	•	•	off	off	on
	•		off	on	on
•	•		on	on	on
•	•	•	on	on	on

Table 2: System & BBB power status based on +5V power sources

#### Logic-level Interfacing to the BBB

The BBB's I/O operates at +3.3V LVTTL levels, referenced to the BBB's VDD\_3V3B power bus.

All of the push-pull GPIO signals from the BBB to the CSK bus connector pass through unidirectional isolators on the MBM 2 and present themselves as CSK bus signals at LVTTL signals referenced to local vCC (normally +3.3V). These isolators are enabled only when the BBB's bidirectional sys\_RESETn signal is inactive, i.e. the BBB is no longer in reset. An inverted, unidirectional version of sys\_RESETn is provided as the -BUFF\_EN output on the CSK bus connector.

When interfacing to any of the BBB's signals mapped to the CSK bus connectors IO.[39..0] signals, note that all are inactive / high-impedance until -BUFF\_EN is active. Based on warnings included with each BBB, it's possible that the prohibition on connecting any signals to the BBB's inputs before its has come out of reset also applies to the analog inputs AIN[6..0]; the -BUFF\_EN signal can be used to gate analog signals that connect to AIN[6..0].

BBB open-collector / open-drain signals like I2C1's **SDA** and **SCL** signals are connected directly to the CSK bus connector; no isolators are involved.

<sup>&</sup>lt;sup>5</sup> See <u>beagleboard.org</u> for more information.

<sup>&</sup>lt;sup>6</sup> It's unclear whether this Digi-Key part number is a generic one for all Rev C BeagleBone Blacks, or just the ones from CircuitCo.

<sup>&</sup>lt;sup>7</sup> This assumes that the EPS connected to the CSK bus connector can handle external +5V power sources on +5v\_sys. This is often true.

### **Reset Supervisor**

A local reset supervisor is provided. Its output is gated through the WDT interface (below) and is used to establish the power-on state of the power-up WDT block. An user-supplied pushbutton switch can be fitted to the MBM 2 to enable manual resets of the BBB.<sup>8</sup>

### Watchdog Timer Interface

The MBM 2 supports an external watchdog timer (WDT) that controls the system **-RESET** and/or **OFF\_VCC** signals. At power-on and whenever **-RESET** is active, the BBB is isolated from the effects of the **-RESET** and **OFF\_VCC** signals via a dedicated WDT interface; this allows the BBB to use its own local power-on/reset circuitry get through boot-up and other actions whose time-to-complete may exceed the external WDT's period. To allow external bus signals to reset and/or power-cycle the BBB, the BBB must explicitly clock the local **GPIO1\_14** signal<sup>9</sup> low-to-high at least once. This low-to-high transition unblocks the **-RESET** and **OFF\_VCC** signals so that when active, they can reset and power-down the BBB, respectively. Once the WDT interface is unblocked, the active-low **-RESET** signal will hold the BBB in reset as long as it is active, and the active-high **OFF\_VCC** signal will power-down the BBB and the MBM 2 as long as it is active. The MBM 2's WDT interface will remain in this state until a reset or system power-cycling event on **+5v\_sys**.

The off-board external WDT should be configured to drive **-RESET** and/or **OFF\_VCC** active when the BBB has failed to kick the watchdog correctly. Typically, a GPIO output from the BBB to the external WDT is used to kick the WDT.

When the MBM 2 is powered via USB, the **OFF\_VCC** signal is effectively disabled on the MBM 2, and cannot power-cycle the BBB. The ability to reset the BBB via external WDT control of the **-RESET** signals remains.

### SD Card Interface

An SD Card socket provides a 4-wire, SPI-mode SD Card interface to the BBB's spi1\_cs0, spi1\_do, spi1\_di and spi1\_sclk signals. The SD Card socket is connected directly to the CSK bus connector's io.[3..0] signals; therefore, it can be accessed by other devices as long as the chip select signal io.0 driven by the BBB's spi1\_cs0 is under organized / arbitrated control.

The SD Card is powered from the local vcc (+3.3V).

The signal lines between the SD card and the BBB have no series resistors; therefore SPI clock speeds in the 20-50MHz range are possible, as long as they are supported by the SD Card.

### **Real-Time Clock**

The 8-pin M41T81S RTC on the MBM 2 functions as a slave I2C device and is connected directly to the CSK I2C bus (sda\_sys & scl\_sys); no I2C isolator is employed. A 3V Lithium coin-cell battery holder is present on the MBM 2; when fitted, the vbackup power bus provides current-limited backup power to the RTC for the purpose of maintaining a real-time clock even when other power sources (+5v\_sys, vcc\_sys, etc.) are not present.

### **Backup Battery**

The MB has a replaceable BR1225 3V Lithium coin cell to serve as a backup battery **BT1** for real-time clocks and other components requiring battery backup of volatile information.

Battery **BT1** is held in place by a coin cell battery holder in one corner of the underside of the MB. The allmetal battery holder is oriented in such a way that once installed onto a CubeSat Kit Base Plate, the battery cannot slide out of its battery holder and is thereby physically restrained along five of six axes.

 $<sup>^{8}</sup>$  The BBB has its own reset button, though it is hard to reach when the BBB is mounted to the MBM 2.

<sup>9</sup> GPI01\_14 is pulled down on the MBM 2.

However, since the battery has a conductive outer shell, excessive movement of the battery along its insertion / removal axis could result in a short if it were to contact the Base Plate. Therefore insulating Kapton tape and/or an epoxy or silicone adhesive should be applied to the battery and battery holder.

Alternately, the customer can feed **VBACKUP** on the CubeSat Kit bus via their own backup battery located elsewhere in the system.

# I2C

The BBB on the MBM 2 normally functions as an I2C master controller on the BBB's **12C1** interface.

By default, I2C pull-ups of  $1.5k\Omega$  are connected to the MBM 2's local vCC supply (+3.3V). Optionally, they can be connected to vCC\_svs (+3.3Vdc). See the MBM 2 schematics for more information.

The MBM 2 does not utilize the BBB's I2C0 (the I2C bus used for control interface, etc.). It remains free for the BBB to use locally.

The MBM 2 does not utilize the BBB's I2C2 (the I2C bus used for Cape identification and enumeration). While I2C2 is pinned out on the BBB's P9, it overlaps the BBB's UART1\_RTSn and UART1\_CTSn signals. These signals pass through unidirectional isolators on their way to the CSK bus connector. Therefore I2C2 is not available on the CSK bus connector, even if the flow control features of the BBB's UART1 are not used.

### **BBB Cape Support**

Because the BBB is mounted "upside-down" on the MBM 2 (i.e., the mating connectors for the BBB's P8 and P9 are male headers on the MBM 2), and because of the I2C2–UART1 flow control overlap (see above), it is not possible to use standard BBB-compatible Capes with the MBM 2 + BBB.

### **BBB Analog Inputs**

All seven of the BBB's dedicated analog inputs AIN[6..0] are mapped to the CSK bus connector signals AN[6..0]. The reference voltage for the BBB's ADC (VDD\_ADC) is mapped to the CSK bus connector signal VREF0; an external reference voltage can be provided via this input. Care must be exercised when applying analog voltages to the BBB if/when the BBB is in reset – see Logic-level Interfacing to the BBB, above.

#### Fitment

The BBB is affixed to the MBM 2 via four custom aluminum spacers. A combined heatsink/spacer is available from the factory.

In some instances, the overall height of the module may be incompatible with certain stackups within a nanosatellite that expects to stack modules utilizing the standard 0.600" board-to-board spacing. In these situations, it may be necessary to trim the **P8** and **P9** header pins on the underside of the MBM 2. It may also be necessary to remove some (unused) connectors of the BBB, e.g. the HDMI connector.

### **RBF and Separation Switches**

The MBM 2 does not support RBF or Separation Switches – they must be accommodated elsewhere if/when required.

# TRADEMARKS

The following are Pumpkin trademarks. All other names are the property of their respective owners.

- Pumpkin <sup>™</sup>and the Pumpkin logo
- Salvo<sup>™</sup> and the Salvo logo
- SUPERNOVA™
- MISC<sup>™</sup>
- CubeSat Kit<sup>™</sup> and the CubeSat Kit logo
